

Which Centre or Partner Needs Attention This Month

Prepared for **Shiladitya Samaddar** — Head, Operations, Skill Development & Entrepreneurship, Tata STRIVE Vocational & job-oriented skilling network

Instead of scanning every number across the network, this report narrows straight to the delivery points that crossed a real threshold this month — and states, in plain language, exactly why each one was flagged.

How to read this

- Every card here is a delivery point that tripped at least one alert rule — the seven not shown are currently clear.
- **At risk** (red) means more urgent — typically a real gap in demonstrated skill. **Monitor** (gold) means worth watching, but not yet urgent.
- The line under each name is the specific reason it fired — for example, too many trainees falling below the readiness bar, or trainees' own sense of how well they did not matching how well they actually did (a "calibration gap").
- In the live dashboard, clicking a card opens the full detail and a recommended next step for that specific delivery point.

Which centre or partner needs my attention this month?

A direct re-grade of Drona's rule-based institute-head alert set (Part G13) — the same thresholds run at the centre/partner level instead of the GIZ institute level. Collapsed by default; click a card for the full rule and the recommended action.

What this tells us

The two at-risk flags — **Implementation Partner — J** and **Implementation Partner — H** — are the same two names flagged furthest below average in both the Money and Reputation reports. Three independent views of the network agreeing on the same two names is a stronger signal than any one of them alone: this isn't a quirk of one particular chart, it's a real, converging pattern.

The five monitor-tier flags are a different kind of issue. Most of them — Implementation Partner G, Extension Centre D, Implementation Partner N, Extension Centre E, and Extension Centre L — were flagged mainly for a **calibration gap**: trainees at those sites aren't accurately judging their own performance, rather than a raw skill shortfall. That's typically a lighter fix than a competency gap — a short, structured exercise where trainees compare their own sense of how they did against how they actually did can often be enough to bring a site back to on-track before it becomes urgent.

How real is this

The rules driving every alert on this page — how many trainees have to fall below the readiness bar, what counts as too large a calibration gap, what counts as over-reliance on the AI tool — are already fully defined and ready to compute the moment real assessment data starts flowing in. Of the four reports in this set, this is the one closest to being real today, since it's a direct reuse of alerting logic already proven for the GIZ programme.

What's illustrative here is which specific centres are flagged this month, and for what — that becomes real the moment live centre data exists.

SUGGESTED NEXT STEP

Start with Implementation Partner J and Implementation Partner H this month — they're the two names showing up flagged in every view across this report set, not just this one, which makes them the highest-confidence place to spend a limited amount of attention first.
