

Where Training Spend Is Turning Into Real Competency

Prepared for **Shiladitya Samaddar** — Head, Operations, Skill Development & Entrepreneurship, Tata STRIVE Vocational & job-oriented skilling network

This report answers one question in plain terms: across every training centre and partner in the network, where is training spend actually producing skilled, job-ready trainees — and where isn't it?

Trainees assessed 2,100	Network avg readiness 56 / 100	% ready (Competent+) 40%	Cost per trainee Pending
-----------------------------------	--	------------------------------------	------------------------------------

How to read this

- Each bar is one delivery point — an owned centre, an extension centre, or an implementation partner.
- **Bar length** is that delivery point's average Readiness Score (0–100) — Drona's underlying competency measure, not a completion count.
- **Colour** marks the band it falls in: green is on track, gold is worth monitoring, red is at risk.
- The list is sorted highest to lowest, so the strongest performers are at the top and the ones needing attention are at the bottom.
- Cost per trainee is shown as **pending** everywhere — Drona measures competency, not spend, so this column will only fill in once Tata STRIVE's own delivery-cost data is connected.

What this tells us

Owned Centre — A leads the network at 71, and the four owned centres cluster tightly together in the high-50s to low-70s — a genuinely consistent story for the centres Tata STRIVE runs directly.

The picture changes once you move into the implementation-partner layer. **Implementation Partner — F** performs almost as well as the owned centres (61), but two other partners running different trades — **Implementation Partner — H** (Automotive Service Technician, 38) and **Implementation Partner — J** (Assistant Electrician, 33) — sit well below everyone else. Those two alone are enough to pull the network's overall "ready" rate down to 40%.

In plain terms: the spend going through owned centres looks like it's reliably converting into competency. The spend going through implementation partners is far more uneven — some partners are performing on par with owned centres, and a couple are not converting spend into competency nearly as well. That gap is the first place to look before assuming the network-wide average tells the whole story.

How real is this

The Readiness Score itself is real — it's the same underlying competency measure (DCI) already built and proven for the GIZ programme, just applied here to vocational trades instead of language assessment. Rolling it up by centre and partner, the way this report does, is a straightforward extension of that.

Cost per trainee is the one piece that doesn't exist inside Drona at all today — it would need Tata STRIVE's own finance data joined in before it becomes real. Every number shown on this page is illustrative sample data standing in for what a live connection would produce.

SUGGESTED NEXT STEP

Ask finance for delivery cost by centre for one course — EV Service Technician is a good candidate, since it's run by both an owned centre and an implementation partner — and compare it against these readiness numbers. That's the fastest way to see whether cost and competency are actually moving together, or where they've come apart.
