

# What the Network Can Credibly Claim About Consistency

Prepared for **Shiladitya Samaddar** — Head, Operations, Skill Development & Entrepreneurship, Tata STRIVE Vocational & job-oriented skilling network

Tata STRIVE's promise is standardised, quality skilling nationally. This report checks whether that promise would survive contact with the network as it actually performs today — and names exactly where it wouldn't.

## How to read this

- Each bar shows how far one delivery point's average sits from the **network average** (56) — not its raw score.
- Bars pointing **right** beat the network average. Bars pointing **left** trail it.
- Colour** shows how much that gap matters: green is at or above average, gold is below average but still defensible, red is more than 15 points below — the point at which a network-wide consistency claim stops holding up.
- Delivery points are sorted from the strongest gap to the weakest, so the two names that would actually break a consistency claim sit at the very bottom.

## What can my network credibly claim about consistency — and where would that claim break?

Every delivery point plotted as its distance from the network average — the way an operations review actually reads a variance chart. Bars pointing right beat the network average; bars pointing left trail it, and colour shows how much that matters.

## What this tells us

All four owned centres sit at or above the network average — a genuinely consistent result, and exactly what a "standardised quality" claim needs to be true. The extension centres sit only slightly below average, which is well within a defensible range.

The claim breaks at two specific implementation partners: **Implementation Partner — H**, 18 points below average on Automotive Service Technician, and **Implementation Partner — J**, 23 points below average on Assistant Electrician. If either of these were the site a funder, a corporate partner, or a journalist happened to visit, a network-wide "we deliver consistent quality everywhere" claim would not hold up to that visit.

These are the same two names that show up furthest below par in the Money report — which is a useful cross-check in itself. It suggests this isn't noise in one particular way of slicing the data; two independent views of the same underlying numbers are pointing at the same two places.

### How real is this

This is the same underlying Readiness Score data as the Money report — nothing new is being measured here. It's the same numbers, re-expressed as distance from the network's own average instead of a ranked list, because that's the more natural way to ask a consistency question.

That means this view becomes real on the same day the Money report's numbers do. Everything shown on this page right now is illustrative sample data standing in for that live connection.

### SUGGESTED NEXT STEP

Partner H and Partner J are worth a closer, specific look — is the gap coming from trainer quality, the trade itself, or the intake profile at that site? The answer decides whether this is a training-delivery fix or a partner-selection question, and those call for very different next moves.
